(EXAMPLE!!!)

Methodology vs Practice

► Method

- Set stocked → (Base case)
- Rotational
 - Random movement → (No improvement/extra cost)
 - Strategic movement (Time)
 - Strategic movement (Rainfall)
 - Strategic movement (Ground cover/DM)
 - Strategic movement (Morphology)

Similar cost
Increasing
potential

► Practice/implementation

- BMP requires skill
- Anything else!

What's skill?

Getting the most out of your feedbase

- ▶ Work out the costs and benefits of the methods
 - ▶ Set stocked
 - ▶ Rotational
 - ▶ Know your fodder flow
 - ▶ Match your demand and supply
 - ▶ Run a high stocking rate relative to carrying capacity
 - ▶ Take control of the plant and animal interface
- } Work with mother nature

Methodology for optimising performance?

- ▶ Rotational grazing
 - ▶ 50-100% more grown
 - ▶ Rest must be based on morphology (physiology)
 - ▶ Quantity
 - ▶ Quality
 - ▶ Survival
- ▶ Increased investment
 - ▶ Infrastructure
 - ▶ Time/labour?
 - ▶ Skill development

Plant process - Leaf stage

► Above ground

Plant process

► Below ground

Right plant right place

Species	LS for Grazing
Ryegrass	2-3
Cocksfoot	3-4
Phalaris	4-5
Prairie Grass	4-5
Fescue	4-5
Kikuyu	2-5

The process

► How all plants grow

Regrowth: Late Phase 1

- ▶ When phase 1 is almost complete:
 - ▶ WSC begin to be stored again
 - ▶ Roots begin actively growing
 - ▶ But there's an imbalance in minerals
- ▶ At this stage, plants are very vulnerable to grazing

Regrowth: Late Phase 1 early Phase 2

- ▶ During this period:
 - ▶ WSC reserves have been built up enough for plants to be grazed again
 - ▶ Roots are actively growing
 - ▶ Tillering **starts** again
- ▶ The balance between minerals in leaves becomes more in line with animal requirements

Regrowth: Late Phase 2

- ▶ When phase 2 is complete:
 - ▶ WSC levels have been fully restored
 - ▶ Root growth and tillering are fully active
 - ▶ Overall live top growth is at a maximum
- ▶ After phase 2 quality declines due to leaf death

Quantity

Quality

Phase	NSC/DIP	RDN (%)	Ca:P	K/(Ca + Mg)	Energy (MJ)
0-1	1:2	35	1:1	8	20%
1-1.5	1:1	25	1.5:1	4	50%
1.5-2	2:1	24	2:1	2.5	100%
Optimal	2:1	19	2:1	2.2	100%

Each of your samples has been allocated a laboratory number and can be identified as follows:

Lab No Your sample identification Collected By
02-A Pasture, Ryegrass 13/08/07

Results of Analysis:

<u>Test</u>	<u>Method</u>	<u>Units</u>	<u>02-A</u>
Moisture	Wet	%	84.1
Dry Matter	Wet	%	15.9
Crude Protein (N x 6.25)	NIR	% of dry matter	26.3
Neutral Detergent Fibre	NIR	% of dry matter	43.5
Digestibility (DMD)	NIR	% of dry matter	86.0
Digestibility (DOMD)	Calculated	% of dry matter	79.7
Metabolisable Energy	Calculated	MJ/kg DM	13.2

Quality

Poor digestibility

Moderate digestibility

Excellent digestibility

Quality

Poor digestibility

Excellent digestibility

Survival

- ▶ Tillers live for roughly a year
- ▶ Overgrazing decreases energy reserves
 - ▶ Plants don't tiller
- ▶ If grazing duration is longer than 2-3 consecutive days
 - ▶ Plant energy reserves depleted (less than 1 leaf)
 - ▶ Regrowth is significantly compromised (10-30%)
- ▶ If greater than 5 consecutive days
 - ▶ Can lead to a 40-60% reduction in re-growth
 - ▶ And 40-50% tiller death

Rotation or rest

- ▶ Is a function of leaf appearance rate
 - ▶ Quality/quantity/survival
- ▶ Daily area fixed!
 - ▶ Nonnegotiable

Measuring Pasture

Animal requirements

- ▶ We use simple rules of thumb (kg DM/hd)
- ▶ Cattle
 - ▶ Maintenance ($\text{Lwt}/100 + 1$ kg DM)
 - ▶ Pregnancy (plus 1-3 kg DM)
 - ▶ Lactation (plus 4 kg DM)
 - ▶ Liveweight (for each kg Lwt add 4 kg DM)
- ▶ Sheep
 - ▶ Maintenance ($2 \times \text{Lwt})/100$)
 - ▶ Pregnancy is plus (1 kg DM)
 - ▶ Lactation requires plus (1 kg DM/lamb)
 - ▶ Liveweight gain (plus 4 kg DM/kg LW)

Recreational golfers splurge on technology aiming to emulate the pros but their investments fail to deliver

We're not alone?

Wasted millions

- Each year Australian golfers spend \$300m to upgrade their equipment
 - Over the last 10 years average handicap has increased
- They're now hitting the ball further in the wrong direction
 - We always tend to believe that our skills are higher than they actually are!
 - That means we can't capitalise on the better clubs!

By JOHN DOOMER
... they do so, a leading technology that grew out of international weapons programs.
... they're not getting any better.
According to a detailed survey of golf in Australia conducted by firm ... handicaps
... all must now play better golf — we do not," was the conclusion of survey authors Jeff Blunden and Alastair ...
Like most things in golf, there is no simple explanation.
The main mistake, according to former touring pro Brett Ogil, is ...
"I've seen the driver but it's not necessarily going to make you hit the ball any further," said Ogil, now a club professional at ...
"Too many people just buy on the ...
... and the handicap goes from 14 to 17 and they're wondering why.
"They've bought the best equipment, but it's not necessarily going to make their game any better."
When they do buy new clubs they must have them fitted to suit the

Left floundering ... many social golfers fail to improve because they over-estimate their ability to use the equipment of professionals like Tiger Woods.
Most (male) golfers think they're much better than they really are, which means their use of ...
... defence industries turned their attention to golf equipment design.
... added more flex to shafts over the years, so that what once might have ...
... It is also important to hit the ball that best suits your game.

The background features abstract, overlapping green geometric shapes, primarily triangles and polygons, in various shades of green, creating a modern, layered effect on the right side of the slide.
